Automatic App update - How to turn it of

If you want to avoid the OneStore app being automatically updated to the latest version, in case the user wants to be familiar with any changes to the new version, here is a tip on how to turn off automatic app updating on your iPad (iOS 7 and up).

If you do not want the App Store to automatically update apps, then this can be deactivated under iOS settings iTunes & App Store and here Updates are deactivated under the field "Automatic downloads".

Now, the iPad will no longer automatically update the app, and the user has the opportunity to become familiar with future releases of the app before it is updated.

The app is then updated manually via the App Store, where you can also see which apps and when they have been updated, under the tab "Updates" in the App Store.
