Extenda Retail

Extenda GO POS Backoffice Release Notes

Version 3.18.0 – release estimated 24.06.2025

Written by

Bjørn Willoch Bjanger, Product owner

Contents in release

3.18.0

These are the major changes in the backoffice version 3.18.0

This version covers work done in sprints 100, 101, 102 and 103. While the work done has focused a lot on integration work in the SJ project, there are also many other work items that are ready. SJ specific tasks are not described in this document.

New features and improvements

- New cashier performance report, showing the number of orders and amounts involved for all sales, returns, cancelled orders, manual discounts given, by all cashiers within a selected time period. The output is a CSV file that make the further analysis easier, as you can pivot or sort as you like in Excel or Google Sheets
- You can now define VAT rate override groups, allowing you to change vat rates used on the products when you sell items abroad. Selection of VAT rate override group happens in POS
- Tracking categories can now be configured to be allowed to be skipped, and also where in the login flow you should select the tracking category options

- A new report for historic prices for a product has been created from the product page, showing the price changes, the date and time of the change, and the logged in user doing the change
- You can now set up email notification for items with low stock, for each shop in the account. This means the right people will be notified and can start the reordering of those products. This is implemented as an integration and will be enabled on the merchant group levels
- You can now add AVIF images to products and categories in backoffice
- You can now set common receipt headers and footers for all shops on the master user page in admin site. This makes it easy to get the same header and footer in all shops. If you put a header or footer on the shop level as well, this will override the default header or footer
- Setup for offline Swish mobile payment has been added, relevant for the Swedish market
- Setup for Softpay card payments has been added, will work for GO POS Android that is coming
- Store has been added to M3 integration to support warehouse logistics for Diplom-Is
- You can now make repeating promotions with a schedule, so for instance every friday from 16 to 18 you can have a happy hour offering
- Loyalty points are now reduced when you make a return
- You can now export and import users (cashiers) in backoffice, making it easier to maintain large amounts of employees without having an integration to AD or a user directory
- On the register page, we now show the software and hardware for the device that has opened a day tally for the register. This information is also listed on the masteruser page in admin site, making debugging easier
- The integration to Ordin has been reinforced to make the token use stronger
- We now only show price regions that are available for a subuser in backoffice, through the shops he is assigned to. This means you can only edit prices for your shops
- Shipping cost for purchase order is now persisted for the products in the purchase order
- Payment reference from additional_data is now exported in transactions CSV export
- Value and expiration date has been added to the gift card emails

- Cash movement events (withdrawal and deposits in POS) have now been implemented in backoffice and accounted for in EOD report
- Price regions are now grouped in set or not set for the product in the pricing popup, so you can easily see if the price has been defined in the region you are interested in.
- Predefined discounts can now be linked to shop groups
- EOD page has been optimized to handle the 28 000 registers in SJ account

Bugs fixed

Numerous fixes and improvements have been made.

- Fix garbage in VAT display in email receipts
- Patching shipping information to null does nothing
- Incorrect accounting accounts
- Impossible to save accounting integrations
- Send more customer data to Xero

API changes
- An important change to the API that will make life easier for new integrations, is the introduction of a type enumeration for all entities. Instead of using type_id for objects, a value that you needed to look up against the endpoint /entity_types for each environment, you can now use string enums that will work across all server environments. Enum values can be gotten from the endpoint https://pos-dv.wallmob.com/public/enums. Orders, that have type id 400 in etail, now has type "Orders", preorders has type "Preorders", order lines have type "Orderlineitems", it is easy and straightforward as that. Type_id is still valid for backward compatibility.
- Allowed attributes for an entity is now added to the API documentation
- There are now external attributes that were moved to main entity. Enable them in API requests: Order – day_tally_id, Order Line Items – vat_rate_id and return_reason_code_id
-

New parameters

The following new parameters are added in this backend release:

- `Shared.Setting.Integrations.LowStockEmailNotifications.Enabled`, enables low stock notifications
- `Shared.Setting.Integrations.Softpay.Enabled`, enables Softpay integration
- `Shared.Setting.Integrations.Swish.Enabled`, enables offline Swish integration
- `POS.Setting.PredefinedOrderComments`, allowing you to create a set of predefined comments for orders
- `Shared.Setting.VatRateOverride.Enabled`, enabling Vat rate override groups
