Extenda Retail

Extenda GO POS Backoffice Release Notes

Version 3.19.0 – release estimated 09.09.2025

Written by

Bjørn Willoch Bjanger, Product owner

Contents in release

3.19.0

These are the major changes in the backoffice version 3.19.0

This version covers work done in sprints 104,105 and 106.

The work period is still dominated by integration work related to the SJ project, these efforts are not listed here. Only generally applicable changes are reported.

New features and improvements

- We now show a warning when other products have the same SKU (barcode) that you try to enter on the product information page. This is allowed, but the information is still handy.
- We now only show orders from your shop in the orders list, if your user is restricted to one or a set of shops.
- A new role privilege allowing you to adjust the price of a product in a sale above the retail price has been added.
- When deleting a customer, we now hard delete the customer for anonymization, also removing links to the customer from related orders
- In the list of shops on the sales report page, we now also show net turnover for each shop

- We have added a button to reactivate an expired license for a master user, in the admin site. This means partners can handle this self without assistance from the backend team
- In product imports, you can now link the imported products to a deposit product. The deposit product must already exist, the id of the deposit product is used in the import
- Deposit products are now showing in the product relations mapping in the Infor M3 integration setup.
- When an AVIF image is selected for products and categories, it is now converted to a PNG before storing the image, as some systems have issues showing AVIF.
- Manually discounted items are now reported on in cashier performance report
- We now warn users that changes are not saved when you move away from the page editing an entity
- Card payments for licenses will now go through Adyen for new cards registered and new accounts created. Old card registrations should be ported
- Indicators on the menu items now show if subitems exist. If you open backoffice from admin site, a button is also shown in backoffice to go back to admin site
- Order sending to Infrasec is now handled in a separate endpoint
- You can now select a shop in product import to import local products for this shop. This is a nice feature for franchise chains. You only see the shops you have access to in the selection list
- Comment field has been added to purchase orders, showing in backoffice and being sent to the suppliers, allowing extra instructions to be given to the suppliers
- You can now define the setup for preorder status emails and SMSes, through parameters available in admin site and on shop page
- A big hurray for doing imports! You can now import files with comma as the separator, removing the need to manually convert files exported from Excel or Google Sheets
- Users in backoffice will now only see stock locations linked to shops they have access to. This removes the possibility to see or edit stock from other shops
- Discounts showing in Xero

- Adyen configuration is now available at the shop level, as setup can vary between stores
- Customer name and mobile phone number is now added to the ticket export
- Header in receipt pdf is now translated

Bugs fixed

Numerous fixes and improvements have been made.

- Packaging quantity being considered when set to 0
- Profit margin in take away is displayed wrong
- Sales lines lose reason codes after bill is shared
- Products can not be filtered by categories in backoffice
- EOD columns in CSV export fixed
- Products with exclude from ordering suggestions set can be added to purchase orders
- Invoice orders not sent to eAccounting
- Card and misc payments go to default account in Xero
- Discount code qualifications are broken in test
- SIE4 files showing wrong accounting date
- Password recovery not working in backoffice
- API pagination does not work as intended
- Fiskaltrust proxy request give 500 error

API changes

- There is a major change in the API this time, making life much easier for integrators working across dev, test and etail environments. The type_id of all entities and attributes can now be stated in the type property using a string enum value that is consistent across all environments. The list of enum values to use can be found at https://pos-etail.wallmob.com/public/enums. Backward compatibility is maintained, but we recommend using type enums instead of type_id that must be looked up against each environment.

- import/json endpoint added for bulk import of all entities. You can now send changes to entities in bulk, rather than one and one object. Use this approach if you are struggling with our friend the rate limiter.

New parameters

The following new parameters are added in this backend release:

- Shared.Setting.ProductCategoryRequired.Enabled, default value false. When set, will give an error when saving products with no category selected
