Extenda GO POS

Backoffice Release Notes

Version 3.21.0 - release estimated 03.02.2026

Written by

Bjørn Willoch Bjanger, Product owner

Contents in release

3.21.0

These are the major changes in the backend version 3.21.0

This version covers work done in sprints 110,111 and 112.

New features and improvements

- New control parameters are added to allow users to be fully restricted from features they are not allowed to see or access
- Allow to search by product SKU in Purchase Order and Giftcard Type > Eligible Sets.
- In Purchase Order additionally allow to search by supplier_reference_id
- As it stands there is no system for discounts or gift cards that, when no longer sold, hides them from the POS view, and they have to be archived in a separate folder, a suboptimal process. The ideal situation would be to have a “Hide” or “Deactivate” option for the giftcard so as to no longer enable the sale, but still allowing clients that have that kind of gift card to use them. This is now supported.
- Free item discounts have been added to the cashier performance report
- Product filter values are now sent to Kibana with the order lines, to enable analysis of sales based on product filter values

- To avoid confusion about cost prices and retail prices that are not set showing as "0,00" as placeholder, the prices are now given this actual value if not set when saving the product, so the price is always defined
- The Z level of menu options are now set higher than toast messages appearing, so that you can access the menus also when the toast is showing
- You can now add product categories to predefined discounts, as you can for promotions, resulting in new added products will also be covered by the predefined discounts using category
- Improvements to purchase order generation: Bundles could be added to purchase orders, they are now blocked. You could not add products with active = 0 manually to a purchase order, this is now possible. Variants with different suppliers now go to the correct supplier
- You can now define discount reason codes in backoffice or through API, these will be selectable as reason for giving a discount in POS when defined
- We now require user email to be set when password is present. You are now allowed to delete a subuser that has a password set, as this has created authentication issues in pos
- Tracking categories are now set in purchase orders sent to Xero
- Improve xero config to set status on credit note payments
- Improved loading speed of gift card page by altering indexes
- Order_device_token, holding the device id of the POS creating an order, is now exported to product sales CSV and transactions CSV
- We now skip failing objects in bulk imports and import the ones that succeed. The failing ones are now listed in an error message email sent to master user
- New API for Bird (previously Messagebird) has been implemented
- We now also notify users about imports succeeding, not just failures
- Danish SAF-T format has been updated and reimplemented
- You can now set minimum points and maximum points on customer groups, and backend will automatically move customers in and out of relevant customer groups based on their current number of loyalty points after each order is treated in the API. This makes it possible to automate a customer club with loyalty levels inside Extenda GO POS!
- We are now sending customer email with updated card balance after purchases with gift cards
- Filtering by supplier for stock report has been improved

- A password policy has now been implemented for new master users, sub users and customers, or for users changing password. The requirements are: At least 12 characters long. A combination of uppercase letters, lowercase letters, numbers, and symbols.
- You can now generate QR code images for login to POS, KDS and Go Ctrl, when this is enabled
-

Bugs fixed

Numerous fixes and improvements have been made.

- Layout template product info now shows the info
- It was possible to add more than one price region as default price region on gift cards in backoffice. This has now been fixed
- Order sum amount was not showing in backoffice under "orders" if products in the orders had been deleted
- Loyalty points cleared after customer sync to Xero has been fixed
- Fiskaly cached tokens are now cleared when failing auth requests
- Error when creating gift cards, not printing QR code
- Race condition on Universal Integration webhook callbacks has been resolved
- Adding sending of company key to Unimicro integration
- Number of items in supply package update fix
- Stock value variant id are now validated against product id
- Catalan flag added to product label translations

API changes

- External attribute added to order line items to store gift card email
- Exclude Customers listing in Customer Groups. Setting customers via Customer Groups must still be working. Include Customers if it's explicitly included in with-clause

Mind that the previous notion of entity types, that had to be given by their id after having been looked up in /entity_types and /entity_attribute_types and used, are now replaced with enum values that are the same across environments, thus making integration much easier. The enums are available at <https://pos-etail.wallmob.com/public/enums> in postman or in browser

New parameters

The following new parameters are added in this backend release:

- Backoffice.TopMenu.Report.CashierPerformance.Enabled
- Backoffice.TopMenu.Report.PurchaseOrderSuggestion.Enabled
- Backoffice.TopMenu.CashMovementEventReason.Enabled
- Backoffice.TopMenu.DiscountReasonCodes.Enabled
- Backoffice.TopMenu.PriceRegion.Enabled
- Backoffice.TopMenu.Report.CashMovementEvent.Enabled
- Backoffice.TopMenu.Report.MyReport.Enabled
- Backoffice.Permission.ApiClient.Disabled
- POS.Setting.CustomerGroupEditing.Enabled, default value TRUE. When disabled, you can't edit customer group memberships for a customer in POS
- Shared.Setting.AllowExpiredVouchers.Enabled, default value false. Allow using expired gift card in API when this parameter is set
- POS.Setting.RequireCustomerWhenShipping.Enabled, default value FALSE
