Extenda GO POS Backoffice Release Notes

Version 3.24.0 - release estimated 19.08.2026

Written by

Bjørn Willoch Bjanger, Product owner

Contents in release

3.24.0

These are the major changes in the backend version 3.24.0

This version covers work done in sprints 119,120 and 121.

Some features have already been made available in hotfixes to 3.23 backend

New features and improvements

- We have now added the first version of AI access to Kibana data, where you can ask for insights into your sales and stock data using natural language. Start using it and give us your feedback on this exciting new feature
- We have now added a delete subscription button to the payment reminder emails sent to customers that has entered a valid payment card. This allows them to terminate the subscription without assistance from a partner or support
- Bill line discount handling improved in Xero accounting integration

- You can now subscribe to sales of tickets, getting an email with information about each ticket sold and who bought it. Makes life much easier if you sell tickets to courses and classes
- Shop mapping is now added to the Unimicro integration, allowing you to report sales for multiple shops into one account
- Time of day can now be used to filter orders on the orders page
- Information about items in low stock notification emails improved
- Improvements for SJ:
 - You can now distinguish between sales made on Windows and Android in CBO order file
 - Merchant number is now hardcoded in Kwick receipt data
 - Kwick bin header information has been added
 - Train synchronization now take 3 days of train information and update shop information in GO POS each day
 - Country VAT information added to Kwick digital receipts

Bugs fixed

Numerous fixes and improvements have been made.

- Stock values on existing products are now created for a stock location added.
- Discount reason code page header is now updated when reason code is updated
- Including VAT was not translated in order receipt PDFs
- Price display for bundles and variants improved for better clarity
- Purchase price made mandatory for variant creation, to avoid variants not being displayed in POS from missing price
- A users role and shop restrictions could be edited by that user
- Customers can no longer be created with a phone number or email that is already registered on another customer
- Stock adjustments are no longer registered as sales in purchase order suggestions
- Stock export no longer reports negative stock as 0 value
- You were only able to add one product to voucher sets

API changes

- Added new attribute `full_gs1_code` holding a string to order line item entity, showing all data scanned from a GS1 barcode
- Attributes added to transaction entity to support downpayments handling:
 - `is_downpayment`, boolean attribute
 - `timestamp`, epoch time for when the transaction was made
 - `user_id`, who did the downpayment

New parameters

The following new parameters are added in this backend release:

- `POS.Setting.FallbackToDeferredAuthorizationForNets.Enabled`, default value `false`. Use deferred auth payments if offline payments fail. This requires an activation on Nets side also
- `alwaysUseTogoPriceinSC0.Enabled`, default value `false`. This parameter allows you to skip the to stay/to go selection screen as the first step in self checkout mode
- `POS.Setting.HidePreparedButtons.Enabled`, default value `false`. Enables hiding the prepared buttons in preorders when this makes sense for your orders

Complete issue list

WM-7503 [ServiceDesk] Updating stock in BO on products added before stock location is not working properly	Testing	3	
WM-7496 Order PDF numbers displayed issues	Testing	3
